Goal : Optimise imaging conditions to obtain SE micrographs from which Ti_3C_2 particle-size distributions (PSDs) can be obtained

Procedure :

- Samples (see [\[Experiment\] SEM stub preparation for PSD V](#)) loaded into SEM chamber and vacuum acquired
- 10 kV accelerating voltage set for electron beam
- WD at 5 mm (analytical working distance (AWD) is 15 mm)
- In-beam secondary electron (SE) detector employed
- Two frames accumulated per micrograph, with image resolution 1024x1024 px
- Spot size of 3.8 nm and beam intensity set at 10 a.u.

Results :

Sample	Filename prefix
5.5×10^{-3} wt% dropcast suspension from 14/01/2020 synthesis	KaiKai

Much improved imaging conditions using a mid-range accelerating voltage, short working distance and in-beam secondary electron detector. Better comprehension of brightness and contrast enhancement. Lower, $\sim 10^{-3}$ wt% concentration air-dried dropcast sample gives improved particle dispersion on substrate. PSD production possible with these images.

.tif files are micrographs, .hdr files are complementary data files for each micrograph.
