

Below is a reminder of interpretation of the final fault geometries with hangingwall derived deltas where sediment is coloured relative to 5 fill intervals shown in **Figure 6** of document **HW.deltas.introduction.pdf**. The sediment source in these experiments is in the hangingwall of the right-hand basement fault (2). Nomenclature indicates the initial location of the delta front in units (eg. HW.100.SLR.0.50 had it's first fill with the delta front at **100** units) which increase in steps of 50 units. An experiment with a constant fill and no delta is shown for comparison (Constant_0.50).

This pdf document provides uninterpreted sections at the end of the five intervals of sedimentation for each experiment.

Experiment: FW.100.SLR.0.50

Time:15 Interval: 1 SLR: 0.5 ●

Time:30 Interval: 2 SLR: 0.5 ●

Time:45 Interval: 3 SLR: 0.5 ●

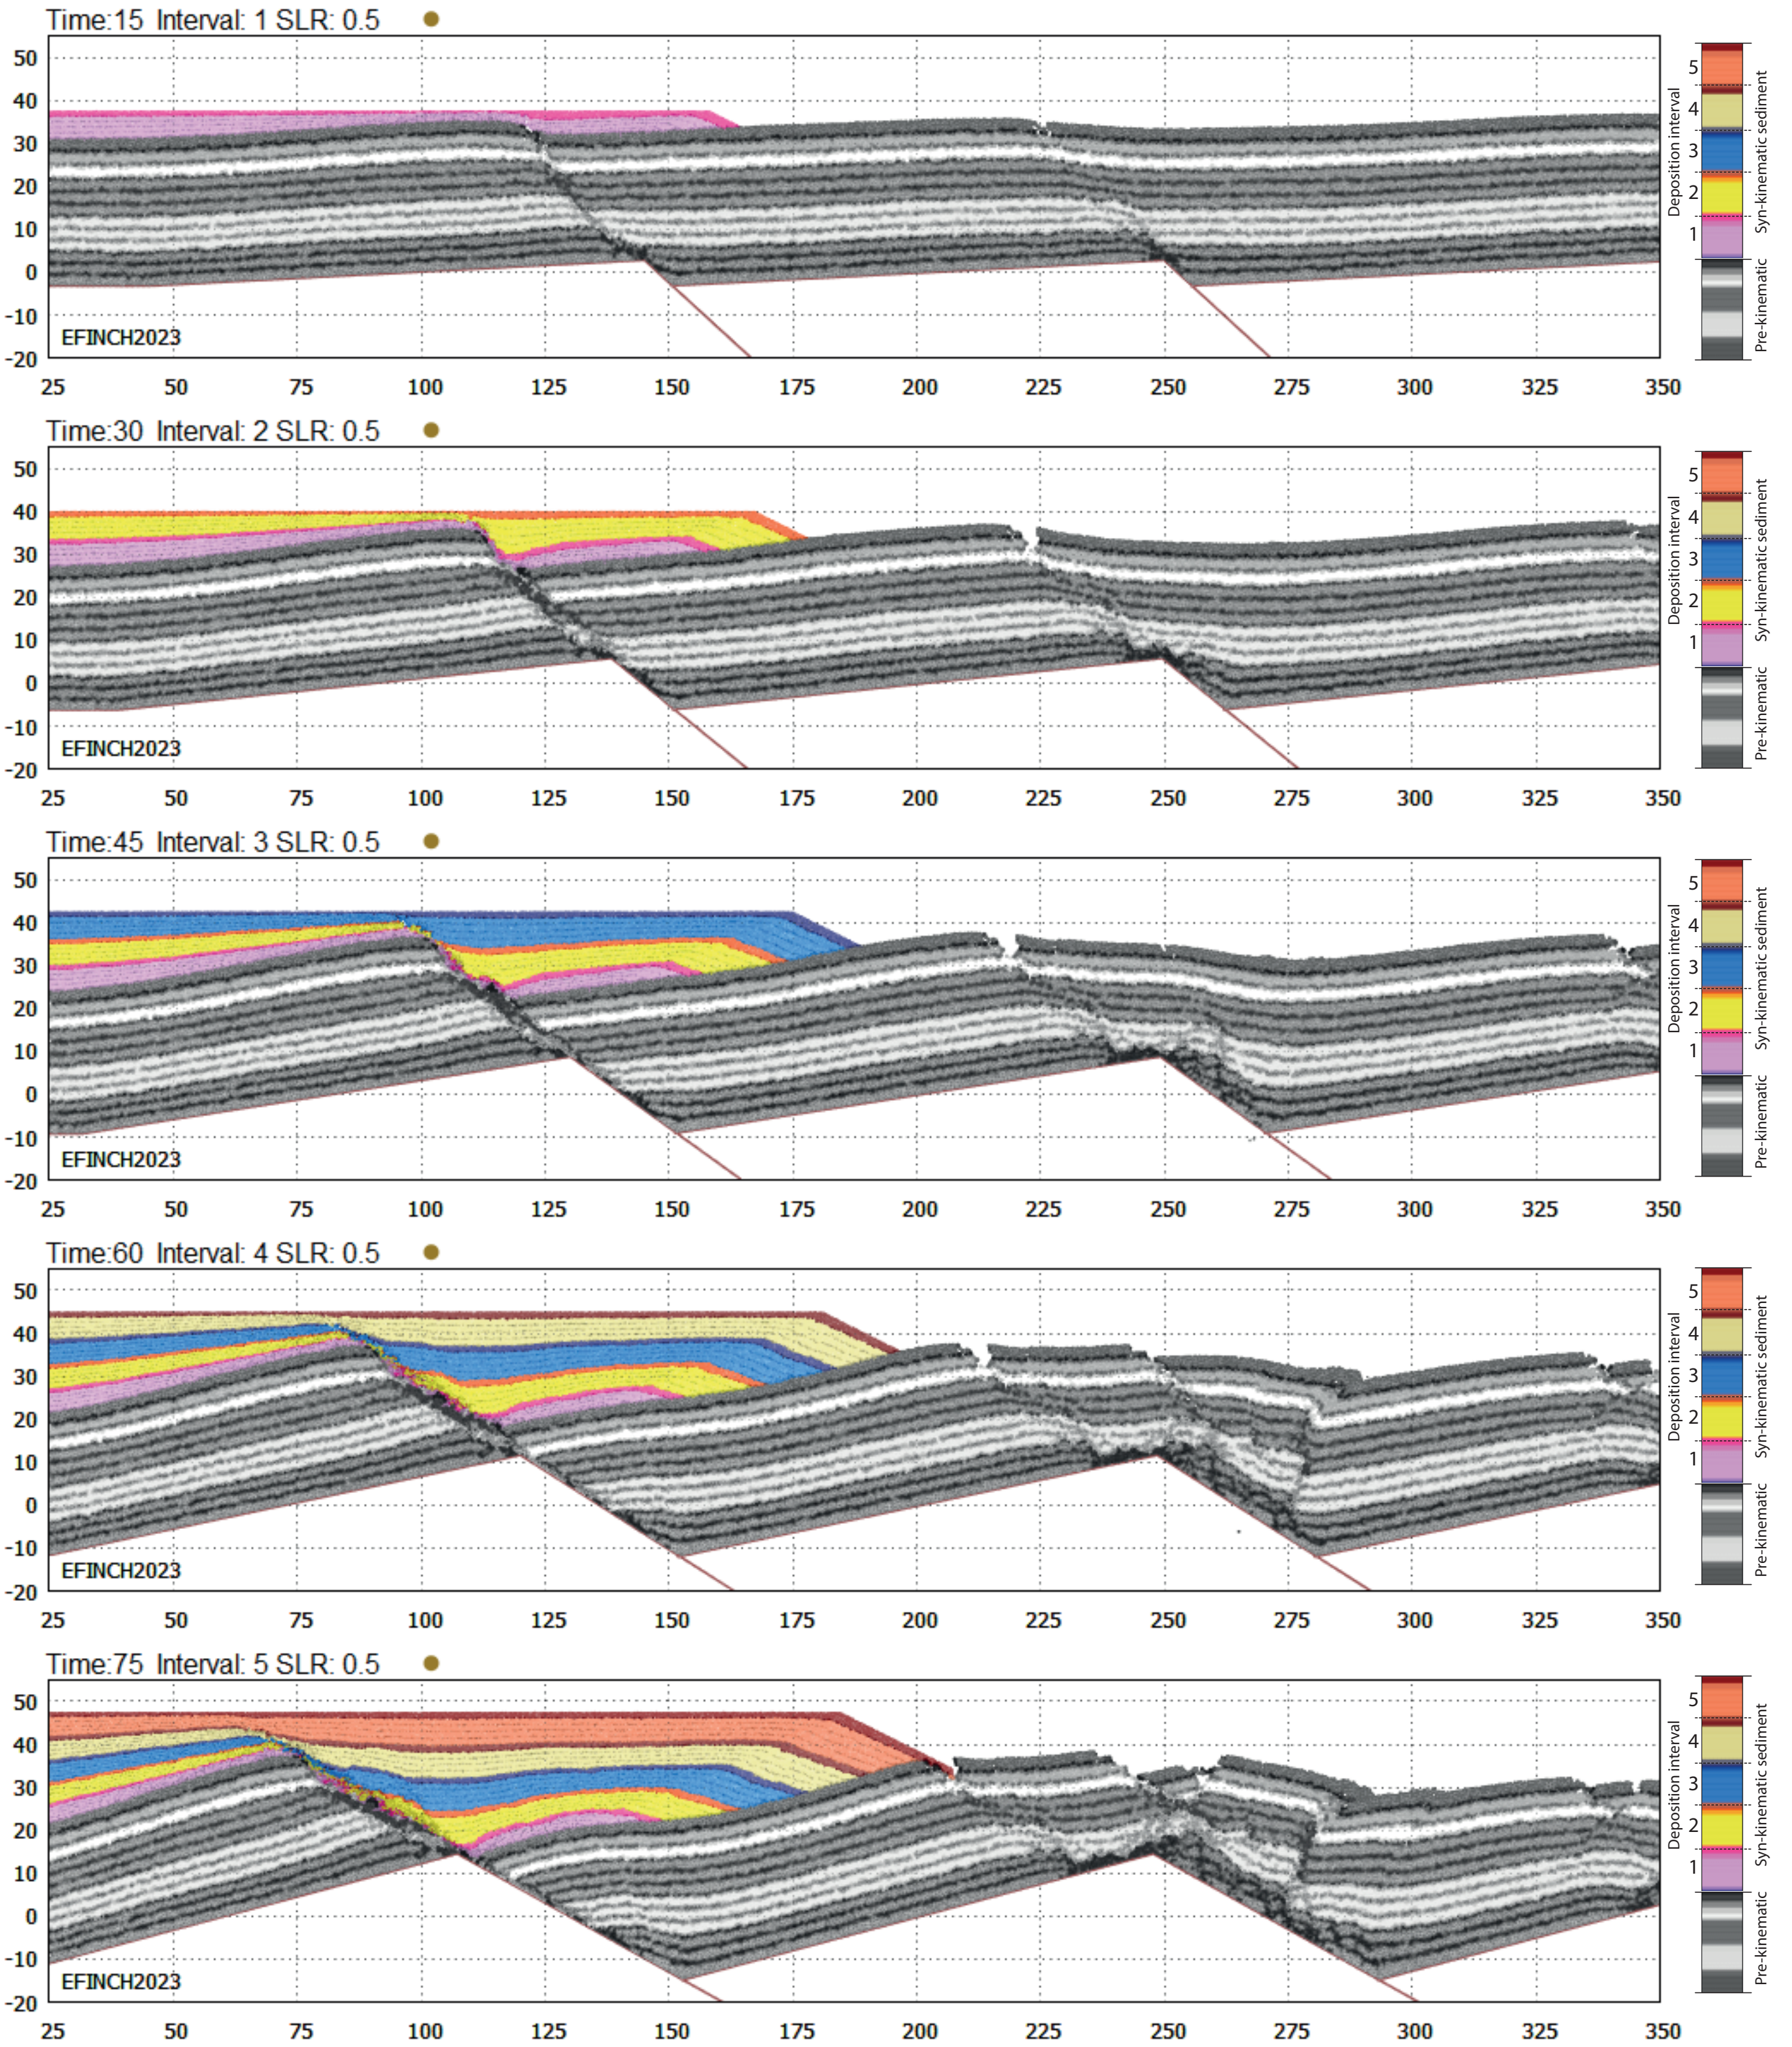

Time:60 Interval: 4 SLR: 0.5 ●

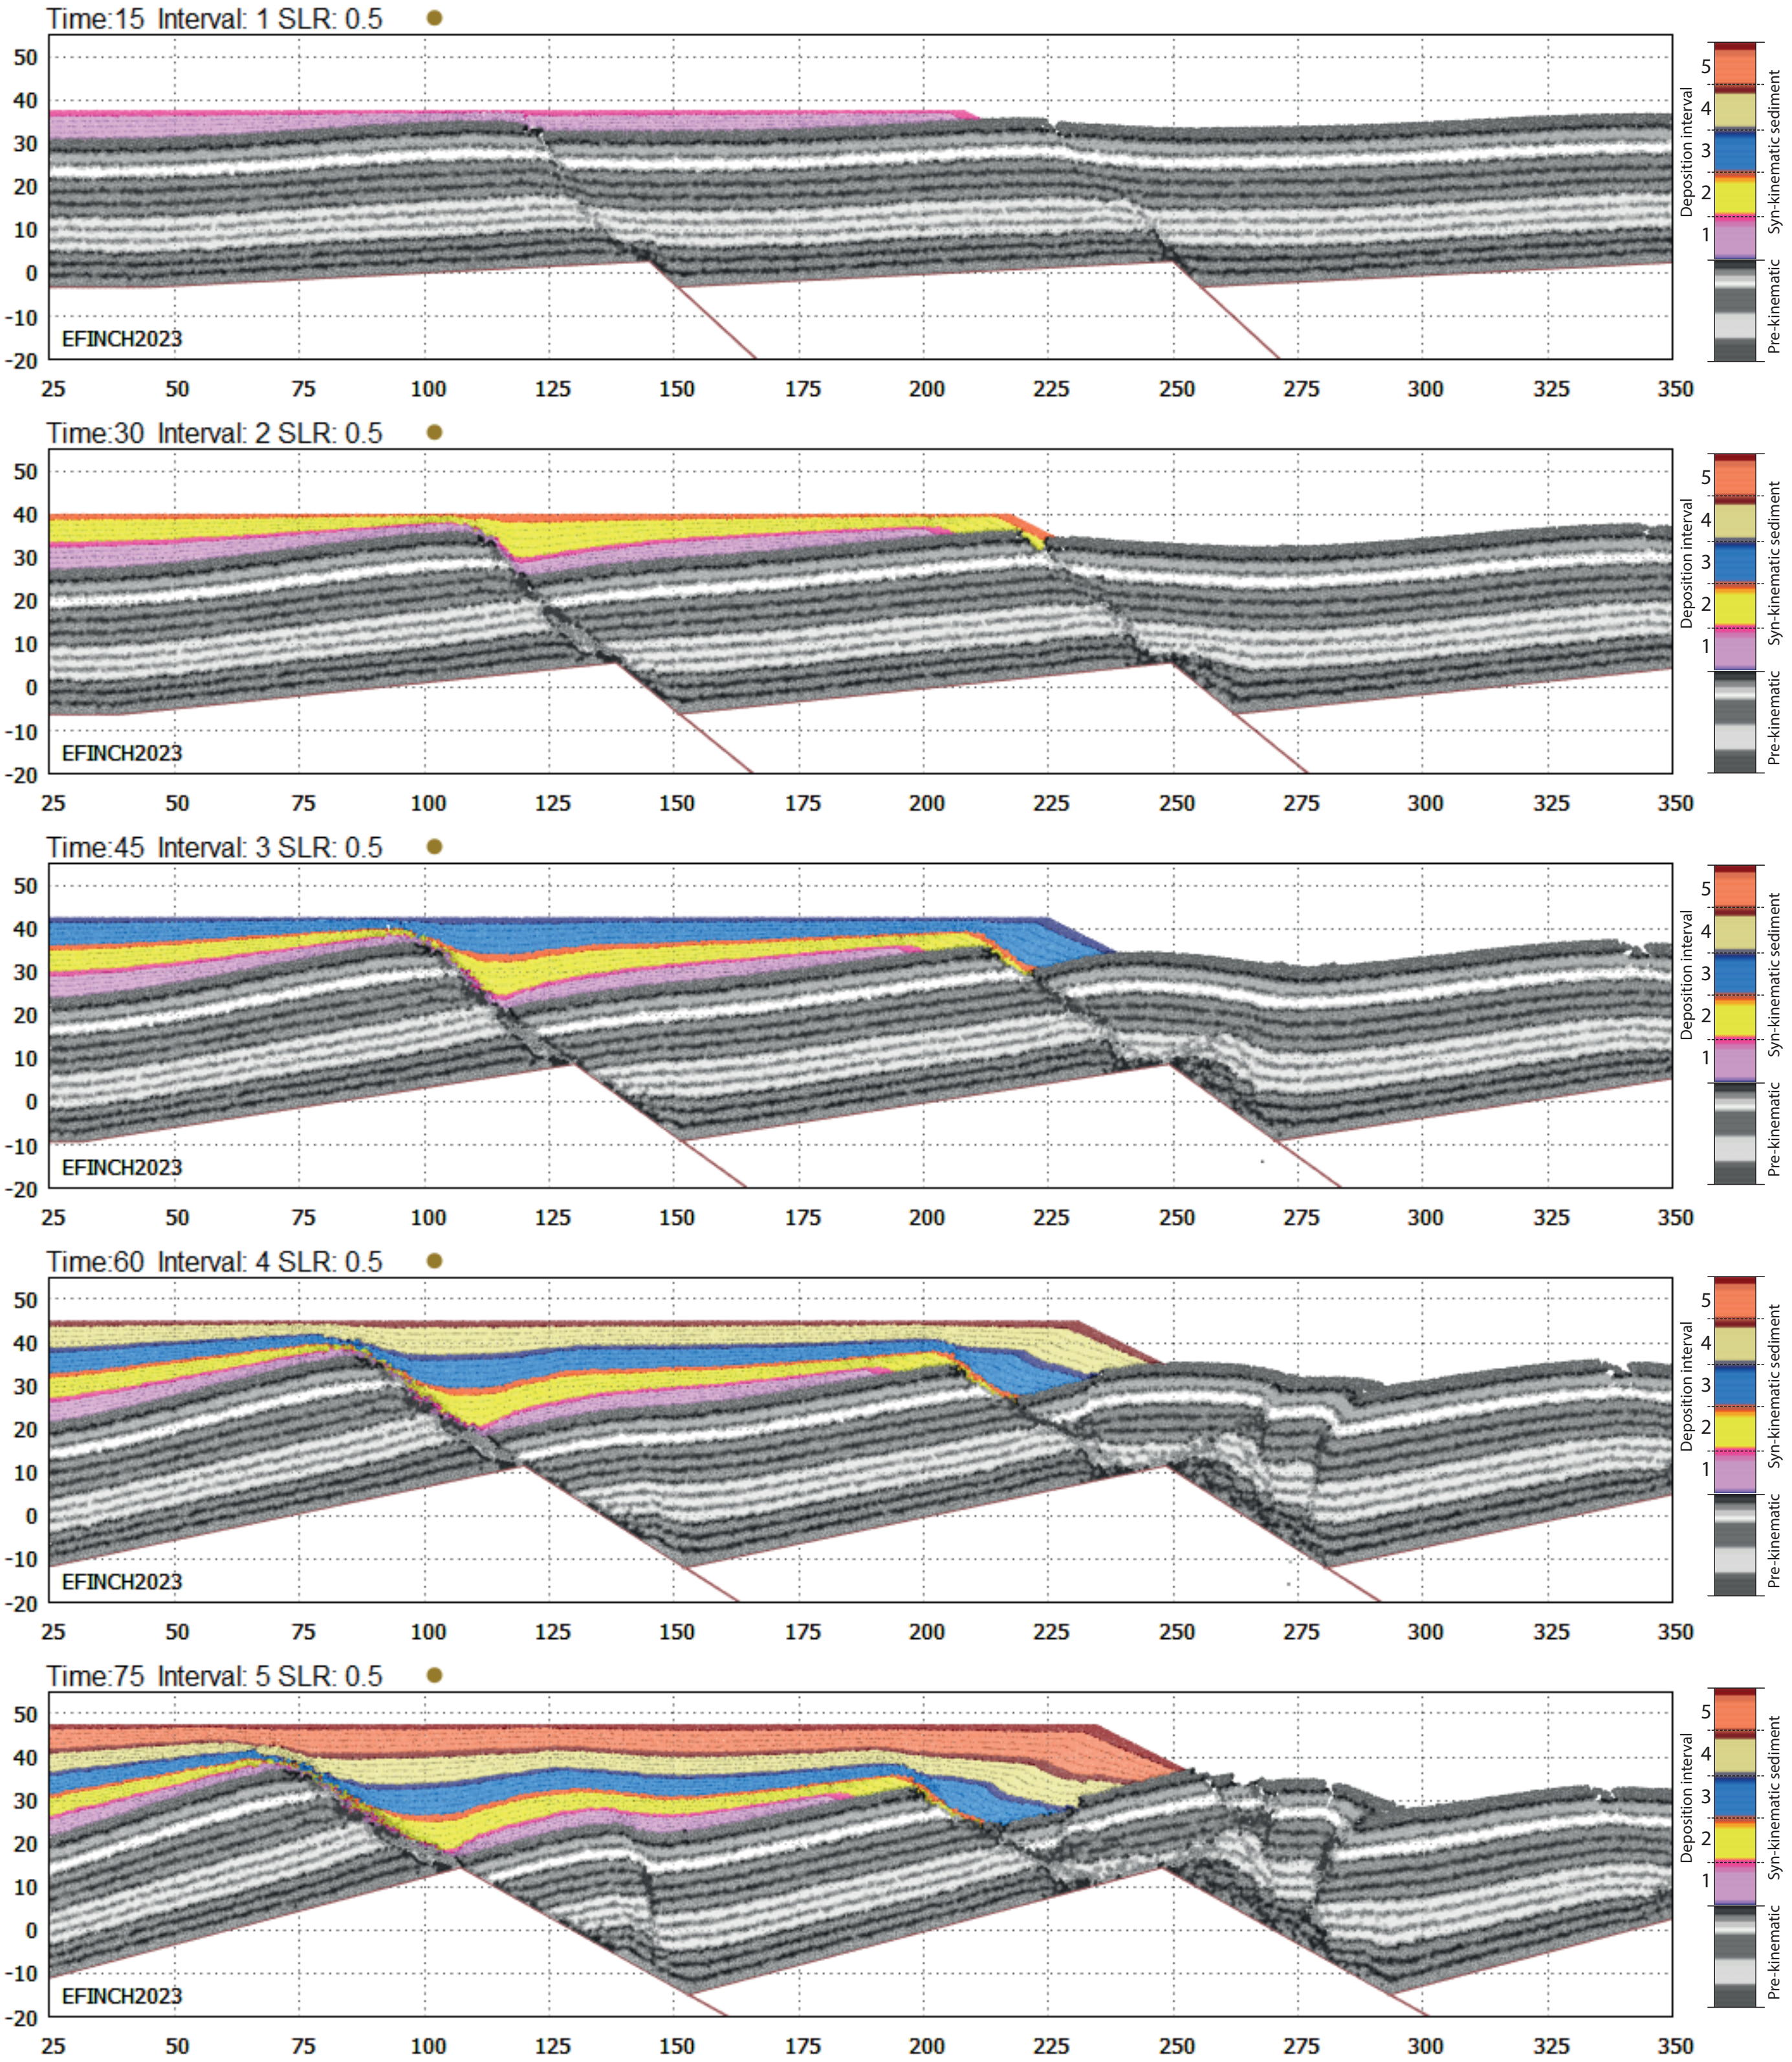

Time:75 Interval: 5 SLR: 0.5 ●

Experiment: FW.150.SLR.0.50

Experiment: FW.200.SLR.0.50

Experiment: FW.250.SLR.0.50

Time:15 Interval: 1 SLR: 0.5

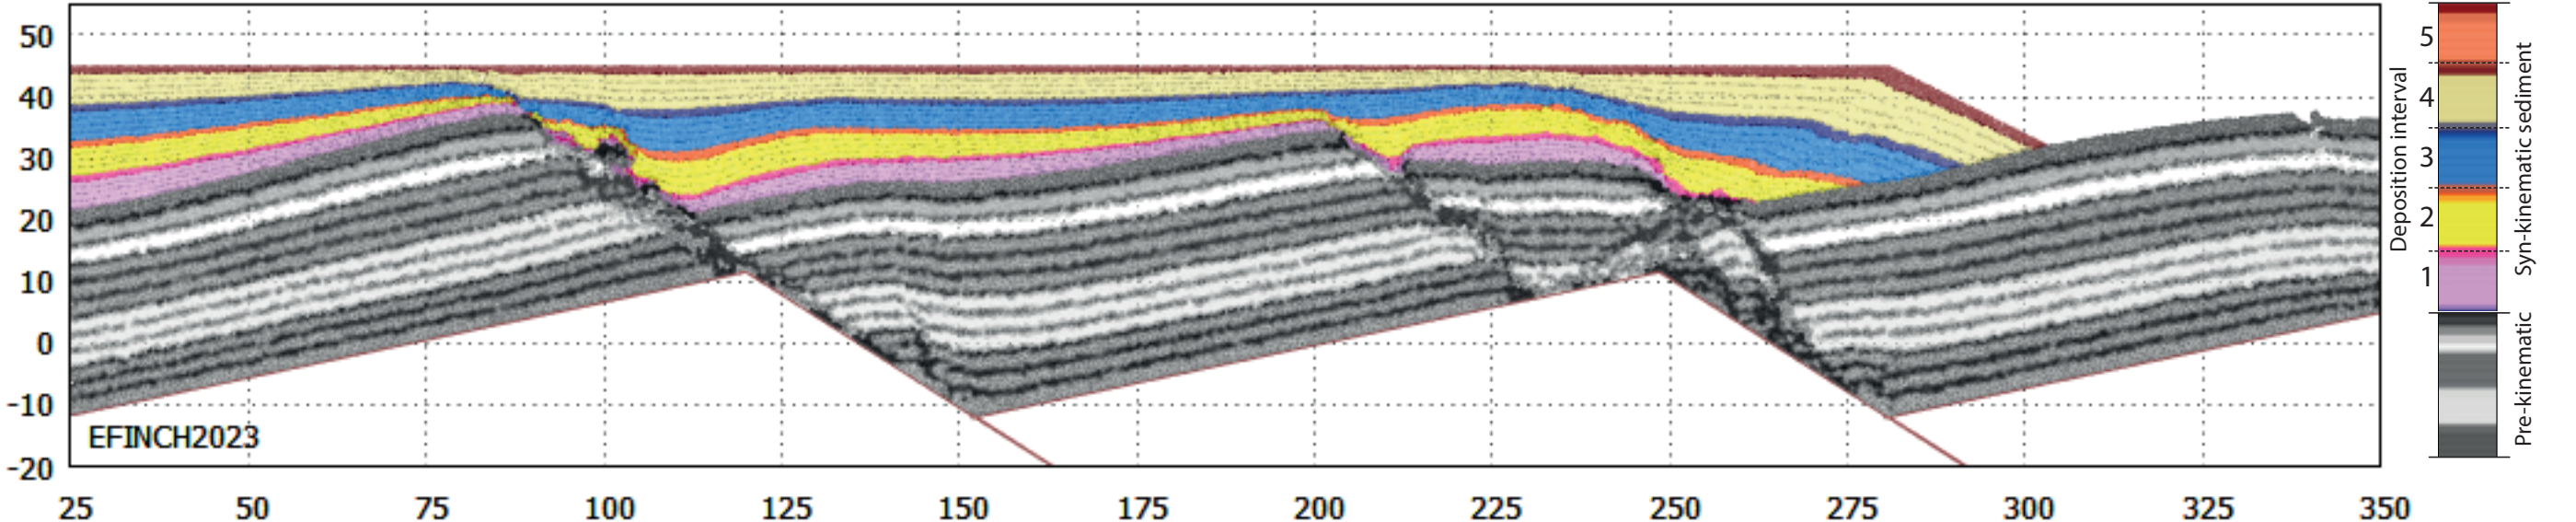

Time:30 Interval: 2 SLR: 0.5

Time:45 Interval: 3 SLR: 0.5

Time:60 Interval: 4 SLR: 0.5

Time:75 Interval: 5 SLR: 0.5

Experiment: Constant_0.50
